

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

**1. (previously presented):** A pattern forming method, comprising image-wise forming, on a surface of a substrate, a region where an initiator having an ability to initiate polymerization is image-wise fixed over the whole area of the substrate and then image-wise exposing to light to inactivate the polymerization-initiating ability of the initiator in the region exposed to light so that the initiator fixed on the region not exposed to light maintains its activity, forming a graft polymer on the region by atom transfer radical polymerization to form a hydrophilic/hydrophobic pattern which includes regions having a graft polymer formed and regions having no graft polymer formed, and applying a substance to the hydrophilic or hydrophobic region of the hydrophilic/hydrophobic pattern,

wherein the atom transfer radical polymerization is conducted in the presence of a transition metal complex as a catalyst.

**2. (previously presented):** A pattern forming method according to claim 1, wherein the region where an initiator having an ability to initiate polymerization is image-wise fixed is formed by fixing a polymerization initiator thereon and the graft polymer contains a monomer having hydrophilicity/hydrophobicity opposite to the hydrophilicity/hydrophobicity of the polymerization initiator.

**3. (original):** A pattern forming method according to claim 1, wherein the substance is a colorant.

**4. (original):** A pattern forming method according to claim 3, wherein the graft polymer contains a monomer having hydrophilicity/hydrophobicity opposite to the hydrophilicity/hydrophobicity of the polymerization initiator.

**5. (original):** A pattern forming method according to claim 3, wherein the colorant is a dye.

**6. (original):** A pattern forming method according to claim 5, wherein the dye has a charge opposite to a charge of the graft polymer.

**7. (original):** A pattern forming method according to claim 1, wherein the substance is fine particles.

**8. (original):** A pattern forming method according to claim 7, wherein the graft polymer has a polar group.

**9. (original):** A pattern forming method according to claim 7, wherein the fine particles each have a charge opposite to a charge of the graft polymer.

**10. (original):** A pattern forming method according to claim 1, wherein the substance is a conductive material.

**11. (original):** A pattern forming method according to claim 10, wherein the graft polymer has a polar group.

**12. (original):** A pattern forming method according to claim 10, wherein the conductive material is fine conductive particles each having a charge opposite to that of the graft polymer.

**13. (original):** A pattern forming method according to claim 10, wherein the conductive material is a conductive polymer comprising a conductive monomer which can be adsorbed by a functional group of the graft polymer through ionic force.

**14-23. (canceled).**
